OVERVIEW

Water Base, page by page

Plain guides to what each page does, what it refuses to do and why, and what happens after you press the button. Written for the people running the business, not for developers.

Each guide is walked through against the live app, so the messages quoted are the words you actually see on screen.

Guides

- **Quotes:** prices sent to customers that nobody has signed yet.
- **Jobs:** sales, from written up to installed.
- **Inventory:** what is on the shelf, promised and on order.
- **Documents:** agreements and work orders, sent, blocked or signed.
- **Schedule:** the week, the crew, and whether the parts are free.

More pages will be added here as they are walked.

The list of faults

- **Known issues:** every rough edge from the guides above in one list, deduplicated, worst first. Nothing on it is fixed.

How to read these

- **"Blocked"** means the app will not let you do something. Every block in these guides is quoted word for word, so you can search for the message you are looking at.
- **"Worth knowing"** is behaviour that is correct but surprising.
- **Anything listed under "Rough edges"** is a fault or an oddity found while writing the guide. Those are not instructions, they are a list of things to fix or decide about.

The short version of the whole app

A job moves through five states:

State	What it means
Quoted	A price the customer has not agreed to. Promises nothing.
Sold	They agreed. No date yet.
Scheduled	It has a date, and its parts are promised for that day.
Installed	The work happened. Parts have left the shelf and the money counts.
Cancelled	Off the books. Parts it promised are released.

Money only counts as revenue once a job is installed. Parts only leave the shelf when a job is marked installed.

GUIDE

Quotes

A quote is a price a customer has not agreed to yet. It is not a sale, so it holds no parts, sits on no calendar, and counts toward no revenue or profit. The Quotes page is the list of them.

Walked through on 2026-09-26 against the live app, and checked again the same day after the ZZ Test rows were deleted.

Getting there

Quotes is its own page in the top bar, under Operations. The dashboard's quotes tile links here too.

Slack reminders about an unsigned quote link to the Jobs page. That is fine: the Jobs page notices the link is a quote and sends you straight here, with the quote open.

Two addresses matter:

- `/quotes` shows every quote.
- `/quotes?view=out` shows only quotes that have been **sent** and are not signed. This is what the dashboard tile counts, so the tile's number and this list are always the same jobs. When this filter is on, the page says so and offers "Show every quote".

What the list shows

Newest first, one row per quote.

Column	What it is
Customer	Name, with the city underneath. If there is no city it says "City not set".
Build sheet	The system being quoted.
Price	The quoted price.
Agreement	Where the paperwork stands: Not sent, Awaiting signature, Opened, Signed, Declined, Expired or Send failed. Underneath, how long ago the quote went out ("sent today", "sent 4 days ago").
Written up	The day the quote was created.

Under the table: a reminder that none of this counts as revenue or gross profit.

Show test quotes. If any quote is flagged as a test, a checkbox appears with the count. Test quotes are hidden until you tick it. No quote carries the flag at the moment, so the checkbox is not on screen at all.

Nothing to show. With no quotes at all the page says "No quotes yet". With the sent filter on and nothing out, it says "No quotes are out", and explains that every quote has either been signed or has not been sent.

Writing a new quote

The **New quote** button at the top right goes to the New job form. That form is a separate page with its own guide, and it is where the customer, address, system, price and the sales checklist answers are entered.

Opening a quote

Click any row, or press Enter on it. The job drawer opens, the same drawer as on the Jobs page. The address bar gains `?job=...`, so the link can be pasted to someone else and it will open on that quote.

If a quote has since been sold or cancelled, opening an old link says: **"That quote is not here any more. It may have been sold, cancelled or removed. Sold and booked work is on the jobs page."**

What is in the drawer, for a quote

Status. Says "Quoted", and explains: a quote promises no parts and counts toward no revenue. It becomes sold when the customer signs, or you can mark it sold here if they closed on the phone.

Two buttons: **Mark sold** and **Cancel job**.

Edit job details. Customer, address, city, phone, email, system, price, deposit, payment type, invoice number and notes.

Payments. Deposits can be recorded against a quote, though normally nothing has been paid yet. The deposit *term* is what the quote email mentions.

Customer agreement. This is where the quote goes out. See below.

Sales checklist. The questions asked in the house. On a quote these can all be answered, including "Not sure yet", which is a real answer at this stage.

Site conditions. Notes for the crew, printed on the work order later.

Crew, pay and invoice number. Present on a quote, though nobody should need it yet. See Rough edges.

Work order. Present but cannot be sent on a quote. See Rough edges.

Reminders. Pause the chasing for this quote for a set number of days.

Parts to deduct and the **stock history** are shown for reference. Nothing is reserved or deducted while the job is a quote.

Sending the quote

In the Customer agreement section, press **Send quote**. It asks to confirm: "This emails [customer] the quote with the agreement to sign. Send it?" Press "Yes, send it".

What the customer gets is the installation agreement itself, sent by DocuSeal, with the quote written into the email:

Subject: Your Michigan Water Pros quote: [system] Hi [first name], Here is your quote for the [system]. What is included: - [each part on the build sheet] Price: \$X Deposit due at signing: \$Y (or "No deposit is due at signing.") To go ahead, review and sign the agreement: [signing link]

Signing that agreement **is** accepting the quote.

After sending, the panel says "Quote sent [date and time]", and the list shows "sent today". Send it again and the button reads **Resend quote**; the panel then counts the sends.

What stops the quote going out

The button is greyed out when the job has no customer email, or when the agreement has already been signed.

If something goes wrong after you press send, the message says what:

- "A quote needs the customer email. Add it to the job first."
- "This job is not a quote any more, so there is no quote to send. Send the agreement instead." Somebody marked it sold, or it was signed, while you had the drawer open.
- "This job has no customer email, so there is nowhere to send the agreement. Add one to the job first."
- "Customer Install Agreement is turned off. Turn it on in Settings first."
- "Customer Install Agreement has no DocuSeal template id. Paste one on the Settings page first."
- "DocuSeal rejected the API key. Check DOCUSEAL_API_KEY." Not something you can fix; send it to whoever maintains the app.

If the email went but the app could not record it, the message says so and tells you **not** to resend, because the customer already has it.

What happens after it is signed

The customer signs in DocuSeal. Without anyone touching the app:

1. The quote becomes **Sold**, dated at the moment of signature.
2. It disappears from the Quotes page and appears on the Jobs page.
3. The agreement shows as Signed, and the signed document is on the job.

If they agree on the phone instead, press **Mark sold** in the drawer. The message reads: **"Marked sold. The quote is now a sale dated today."**

Either way it is a sale from that point: it can be given a date, a crew and an install.

Reminders

A quote that has been sent and not signed is chased in Slack on the mornings it is **2, 5 and 10 days old**, and then never again. After ten days it appears on the dashboard's Needs attention list as "Quote unsigned N days".

Pausing reminders on the quote stops those, and test quotes are never chased.

Things people try that do not work

Giving a quote a date. Refused: **"A quote cannot have a scheduled date. Mark it sold first."**

Marking a quote scheduled or installed. Refused: **"This job is still a quote. Mark it sold, or have the customer sign, before it can be scheduled or installed."** The same message comes back from the schedule page.

Finding a quote on the Jobs page. Quotes are not there. That page is sold and booked work. Likewise a sold job is no longer on the Quotes page.

Resending after signing. The send button is gone once the agreement is signed, and the panel says signed agreements are not resent from here. Start a new one in DocuSeal if the contract genuinely changed.

Sending a work order. It will refuse until the job is sold, has a crew, a payout, a date, a build sheet with parts on it, and an invoice number.

Expecting the quote to reserve stock. It does not. Parts are promised only when a sold job is given a date, and they leave the shelf only when it is marked installed. Two quotes for the last tank in stock will both quote it.

Expecting quotes in the P&L. They are in neither revenue nor profit, anywhere, until the job is installed.

Rough edges

Found while walking the page. These are faults or decisions, not instructions.

1. **"Show test quotes" and the Needs attention list disagree about what a test is.** This page hides a quote only when it carries the test flag. The dashboard's Needs attention rule also treats any name containing "test" or "ZZ" as a test. The quote that showed this, "ZZ Test - Sept 17 quote", was deleted on 2026-09-26, so nothing demonstrates it today, but the two rules still differ and the next test quote typed in without the flag will show here as a real sale. Worth making both places use the same rule.

1. **A quote shows a "Crew, pay and invoice number" section.** Nothing on a quote needs a crew, and saving one does nothing useful until it is sold. It is also the one place a quote can be given a payout, which then counts against the margin of a sale that has not happened.
1. **A quote shows a Work order section that can never send.** It sits there listing everything missing. On a quote the answer is always "it is not a sale yet", which the panel does not say.
1. **The drawer says "Change the date on the schedule" on a quote,** and links there, but the schedule refuses quotes. The link should not be shown until the job is sold.
1. **The Quotes list has no total.** A column of prices with nothing adding them up, when the dashboard tile does total them. Anyone comparing the two has to add the column by hand.
1. **A quote can be given a deposit payment.** The Payments panel accepts money against a price nobody has agreed to. Probably harmless, possibly wrong, and worth a decision rather than an accident.
1. **The one quote on the system has never been sent.** After the test rows went, a single quote is left, named "Steve", for \$2,999 on the Flagship Bundle, never sent. So the page has still never been seen in its normal working state: a list of quotes out with ages against them, and the sent filter showing something. Worth sending one real quote before relying on this page. "Steve" also looks like somebody's own test, and neither the flag nor the name rule catches it.

GUIDE

Jobs

A job is a sale. It holds a price, a build sheet, a crew, and the parts that will leave the shelf when the work is done. The Jobs page is the list of them, from written up to installed to cancelled.

Quotes are not here. A quote is a price nobody has agreed to, so it lives on the Quotes page until it is signed or marked sold.

Walked through on 2026-09-26 against the live app.

Getting there

Jobs is in the top bar under Operations. Three addresses matter:

- `/jobs` shows every job except quotes.
- `/jobs?view=not-booked` shows sold jobs with no date, which is what the dashboard's "Sold, not booked" tile counts.
- `/jobs?view=attention` shows jobs missing something that affects the money or the paperwork, with the reason on each row. That is the "Needs attention" tile.

With a view on, a banner names it and offers "Show all jobs".

Opening a job adds `?job=...` to the address, so the link can be pasted to somebody else. Slack messages and the dashboard both link that way. If the link turns out to be a quote, the page sends you to the Quotes page instead of saying the job is missing.

The four figures at the top

Figure	What it is
Gross profit	Price less parts less installer pay, added up for the jobs on screen. Jobs that cannot be costed are left out rather than counted as pure profit, and the note underneath says how many are settled and how many are still expected.
Contracted value	The sum of the prices, installed or not. This is not revenue. Profit and loss counts only installed work.
Parts	The ledger figure where a job has installed, the expected figure where it has not.
Installer pay	What the crew is owed or was paid on those jobs. Jobs with no payout recorded are left out, and the note underneath says how many.

The figures follow the filters. Cancelled jobs stay in the list but never in these totals, and a line under the table says how many were left out.

Filters

- **Status:** All, Sold, Scheduled, Installed, Cancelled. Quoted is not offered, because quotes are not on this page.
- **Search:** customer name, address or invoice number.
- **Show test jobs:** appears only when a job is flagged as a test, with the count. Test jobs are hidden until you tick it.

Empty results say which filter emptied them: "Nothing matched that search" or "No jobs with that status".

The table

Nine columns, and every heading sorts. Click once for the interesting end of that column, click again to reverse.

Column	What it shows
Customer	Name, city underneath, and on a filtered view the reason the job is on the list.
Build sheet	The system sold.
Price	The sale price.
Parts	The deducted cost once installed, otherwise the expected cost, tagged so the two are never confused. A job whose parts list cannot name every item reads "Not costed yet" rather than a number.
Pay	The installer payout, or "Not set" where nobody has entered one. A payout of \$0.00 is a decision; a blank is not read as one.
Gross profit	Price less parts less pay, or blank when the job is not costed. A job with no payout recorded reads "Pay not set" rather than showing a profit that assumes the crew worked for nothing.
Status	Sold, Scheduled, Installed, Cancelled.
Agreement	Where the customer agreement stands.
Key date	Installed on, Scheduled for, or Written up, whichever applies.

Sorting rules worth knowing: a blank cell always sinks to the bottom, whichever way the column points, so a job with no parts figure is never shown as the cheapest. Status and Agreement sort by how far along they are, not alphabetically.

Opening a job

Click a row, or press Enter on it. The drawer holds, in order: the job's details and an Edit button, the schedule line, Payments, Customer agreement, Sales checklist (sold jobs only), Site conditions, Crew and pay, Work order, earlier signed documents, Reminders, the parts the job will consume, and its stock history.

The two sections that move a job are **Status** and **Crew, pay and invoice number**.

Status, and the buttons that move a job

Sold: pick a date and press Mark scheduled. That puts it on the calendar and promises its parts. Or press Mark installed to record work already done.

Scheduled: Mark installed, or Back to sold, which clears the date, takes it off the calendar and releases the parts.

Installed: a "Move back to" choice of Scheduled or Sold, then Reverse install, which returns every deducted part to inventory.

Any open job: Cancel job, behind a confirm that says cancelling releases every part the job promised.

Cancelled: it can be reopened.

What each action says when it works

- **Mark installed:** "Marked installed. 6 items deducted, \$1,712.16 of parts." If the sheet has no parts at all it says so instead of pretending.
- **Reverse install:** "Install reversed. 6 items were returned to inventory, and the job is now Scheduled with its parts promised again."
- **Back to sold:** "Back to sold. The date is cleared, the job is off the calendar, and any parts it had promised are back in available."
- **Cancel:** "Job cancelled. Every part it had promised is released and back in available. Nothing moved in the ledger, because a cancelled job never consumed anything."
- **Reopen:** "Job reopened as Sold. It has no date, so it promises no parts until it is scheduled."

What blocks a save, word for word

A pick the build sheet needs is missing. Marking installed is refused and nothing is half deducted:

Nothing was deducted. These template lines have no matching inventory item for the choices on this job, finish "N/A", RO type "No RO" and valve type "none selected": customer_pick line for Valve.

Set the finish, RO type or valve type on the job and try again.

The job is already installed:

This job was already installed on Aug 19, 2026 at 12:00 PM and its parts were already deducted. Reverse the install first if you need to redo it.

Reversing a job that never installed:

This job has no deducted parts to reverse.

Changing the parts list of an installed job:

This job installed on Aug 19, 2026 and its parts are already in the ledger, which is append only. Its parts list cannot be changed. Reverse the install first if the list was wrong, which returns the parts to inventory.

Clearing the invoice number:

A job always has an invoice number. Type the number you want rather than clearing it.

Emptying a field that already had something in it (customer name, phone, address, city, payment type, invoice number, deposit):

The customer name cannot be emptied once set. Correct it rather than clearing it, or leave it as it was.

Typing a status straight into the database, which the app never does but a script might:

A job becomes installed through `mark_job_installed()` so its parts are deducted from inventory.

An unanswered sales checklist stops a sold job being given a date, a crew or an install, and names the questions:

This job cannot be given a date while the sales checklist still has a question marked Not sure yet: [the question]. Answer it on the job's sales checklist first.

What happens after

- **Marking installed** takes the parts off the shelf at the cost stamped on each row, sets the install date, and moves the job into that month's Profit and loss. Its parts list is fixed from then on, and so are its crew and pay.
- **Scheduling** promises the parts for that day. They are still on the shelf, but no longer free for another job.

- **Cancelling** releases the promises and takes the job out of every total, while leaving it in the list.
- The list reloads after every action, so the figures at the top move with it.

Things people try that do not work

Editing pay after installing. Crew and pay only show on open jobs. To correct them, reverse the install, fix the pay, install again.

Typing a date and expecting the job to be booked. The date and the word go together: Mark scheduled is what claims the parts.

Finding a quote here. Quotes are on their own page, and Quoted is not in the status filter.

Deleting a job. There is no delete. Cancel is the way out, and it keeps the record.

Changing what an installed job consumed. The stock history is append only. Reverse the install first.

Expecting Contracted value to match Profit and loss. One is every contract on the page, the other is installed work in a month.

Reading Gross profit as final on a job that has not installed. Until it does, parts are today's expected costs, tagged as expected.

Rough edges

Found while walking the page. These are faults or decisions, not instructions.

1. **Saving a new job as Installed can create a duplicate.** On the New job form the row is saved first and the install runs second. If the install is refused, the form stays filled with Save still active, and pressing it again writes a second job with the same revenue and reservations.
1. **Escape throws away edits even after you choose to keep them.** "Edit job details" opens inside the job drawer, and both listen for Escape, so one press closes both. Answering Cancel to "Close without saving?" does not save you.
1. **Closing the drawer discards unsaved crew, pay or site conditions with no warning.** Clicking outside it, or pressing Escape, is enough.
1. **Pay cannot be corrected after installing, and nothing warns you first.** Marking installed does not check that a payout was entered, so a job can be recorded with \$0 pay and an overstated profit, and the only way back is to reverse the install.
1. **Fixed on 2026-09-26: missing pay counted as zero.** A job with no payout showed profit as though the crew worked for nothing. Pay now reads "Not set", and the job shows no profit figure until a payout is entered.
1. **Fixed on 2026-09-26: a part added without a cost counted as \$0.** A part can now be saved with no cost at all, which is different from a cost of zero, and a job using one says its parts figure is a floor

rather than showing a profit that is too high.

1. **Reverse install and Back to sold both run on one click.** They move stock and release parts. Cancel, right beside them, does ask first.
1. **The refusal for a missing pick is written for a developer.** It says "customer_pick line for Valve" and "template lines", when the fix is to choose a valve type on the job.
1. **The four figures at the top do not add up.** Contracted value and Parts include jobs that cannot be costed; Gross profit leaves them out. Price less parts less pay will not equal the profit shown.
1. **"Change the date on the schedule" is shown on installed and cancelled jobs,** where the schedule cannot help: it sends you back here.

GUIDE

Inventory

What is on the shelf, what is promised to booked jobs, and what is on order.

The number on hand is never typed in. It is the sum of every movement ever logged for that part, so a new item starts at zero and gets its count from a logged purchase. That is also why stock can be corrected but never rewritten.

Walked through on 2026-09-26 against the live app.

Getting there

Inventory is in the top bar under Stock. The dashboard's shortage panel links here too.

The six figures at the top

They follow the category filter, so filtering to Faucet gives the figures for faucets only.

Figure	What it is
Value on hand	On hand multiplied by unit cost, added up. Parts with no cost recorded are left out and counted underneath, because a count times an unknown is not zero dollars.
Items	How many parts are in the list.
Promised to booked jobs	Units set aside for scheduled jobs that have not installed. Still on the shelf, not free to sell.
Needs reordering	Parts at or below their reorder point.
Short	Parts where more is promised than is on the shelf. This is not the same as needing a reorder: short means a promise the shelf cannot keep.
On order	Units bought and not arrived.

Under the figures, **At the reorder point** lists the parts worth buying, with the same category filter applied.

The table

One row per part, sorted by category then name. Click any row for its history.

Column	What it shows
Part	Name, then SKU and variant underneath. An inactive part says so.
Category	Softener, RO, Faucet, Valve, Media, Consumable and so on.
Available	A bar: what is free once promises are taken off.
On hand	The ledger total, with a "Reorder" tag when it is at or below the reorder point.
Promised	Units held for booked jobs.
On order	Units on a supplier order, with the earliest expected date.
Unit cost	What one costs today, or "No cost" where nobody has recorded it. Zero means genuinely free.
Value	On hand at that cost, or "Unknown" where there is no cost.

Adding a part

+ **Add item** asks for SKU, name, category, variant, unit cost, reorder threshold, active, and notes.

- **SKU, name and category are required.** Leave one out and you get "SKU is required.", "Name is required." or "Category is required."
- **Unit cost is optional.** Leave it blank if you do not know it yet, and the part reads as having no cost recorded rather than as free. A figure must be zero or more: "Unit cost must be zero or greater, or left blank if you do not know it yet."
- **Reorder threshold** must be a whole number: "Reorder threshold must be a whole number, zero or greater."
- **A SKU already in use** is refused by name: `SKU "SALT-40" already exists. Pick a different SKU.`

A new part starts at zero on hand whatever you type elsewhere, because stock comes from movements.

Logging a movement

Log a movement is how stock changes by hand. It asks for the part, the type of movement, a quantity, and optionally a reference and a note.

The types come from Settings, and each one knows which way it moves stock:

Type	Direction
Purchase	in
Return	in
Install	out
Damage	out
Warranty replacement	out, and must name the job the failed part went in on
Adjustment	either, so the form asks add or remove

What it refuses, before anything is written:

- "Pick an item."
- "Pick a transaction type."
- "Quantity must be greater than zero."
- "Quantity must be a whole number."
- "This transaction would not change stock."
- "Pick the job the failed part was installed on. A warranty replacement is always traced to its install."

The form shows what the count will be afterwards, and warns when a movement would take a part below zero. **It does not stop you.** The database allows a negative count, because a shelf that has been counted wrong is a real thing and refusing to record it would leave the app and the shelf disagreeing with no way to say so.

Changing a unit cost

Open a part and edit its cost there. Saving says what it did: "Saved. 4 on hand now values at \$30.72.", or if nothing is on hand, "Saved. Nothing is on hand, so this takes effect when some arrives."

Clearing the box is allowed and means nobody knows the cost. The part then leaves the value on hand, and any job using it shows no profit figure until it is priced. A cost of zero is different and is treated as real: the two control valves are zero because the valve is already inside the landed cost of the system it arrives in.

Changing the cost does **not** rewrite history. Every movement keeps the cost it was logged at, which is why an installed job's parts cost never moves again.

The history of a part

Clicking a row opens its movements, newest first, with a running balance beside each so you can see what the count was after every step. The columns are date, type, quantity, balance, unit cost at the time,

reference and note. The unit cost editor sits at the top of the same window.

The job a movement belongs to is **not** shown here. An install logged against a job carries that job's invoice number in the reference, which is the only hint. To see what a job consumed, open the job instead.

What cannot be changed, and what happens if you try

The ledger is append only. There is no edit and no delete on a movement, anywhere in the app. At the database level a signed-in user's attempt to change or remove one silently matches no rows, and anything with more privilege is refused outright:

The inventory ledger is append only. A movement is corrected by logging another one, never by changing or removing a row.

To correct a mistake, log the opposite movement. An adjustment in the other direction, with a note saying why, leaves both the error and the correction on the record.

A part that has ever moved cannot be deleted. The database refuses because its history points at it, and the app shows "Another record still points at this one, so it cannot be removed." Switch it to inactive instead: it stops appearing on new build sheets and keeps its history.

An installed job's parts cannot be edited. That is the same rule seen from the other side, and it is why reversing an install is how a wrong parts list gets fixed.

What moves stock, and when

Action	Effect
Booking a job	Promises parts. Nothing leaves the shelf.
Marking a job installed	Writes install movements at the cost stamped on each row. On hand falls.
Reversing an install	Writes return movements. On hand rises again.
Cancelling a job	Releases the promises. The shelf does not move.
Receiving a supplier order	Writes purchase movements, and updates the part's unit cost to what was actually paid.

Things people try that do not work

Typing a new on hand count. There is no such box. Log an adjustment and the count follows.

Editing a movement that was logged wrong. Log the opposite one. The history is meant to show that a mistake happened.

Deleting a part to tidy the list. Make it inactive.

Expecting available to match on hand. Available is on hand minus what booked jobs have promised.

Expecting a booked job to have taken stock already. It has not. Only installing moves the ledger.

Reading "Short" as "needs reordering". Short means more is promised than exists. Needs reordering is a threshold warning, and a part can be one without the other.

Rough edges

Found while walking the page. These are faults or decisions, not instructions.

1. **"Needs reordering" counts more than the list beneath it shows.** The figure counts every row at or below its reorder point, including inactive parts and any part sitting at zero with a threshold of zero. The "At the reorder point" list under it leaves those out, so the card can read 14 while the list shows 2.
1. **"Short" can disagree with the dashboard.** This page counts any part with negative availability, including inactive ones. The dashboard only counts active parts actually promised to a job, so Inventory can say "Short 3" while the dashboard says parts are clear.
1. **Fixed on 2026-09-26: a new part defaulted to a unit cost of zero, and a zero cost counted as known.** The cost box starts blank now, blank means nobody has recorded it, and every figure built on it reads as unknown rather than as free. Zero still means free, which is what the two control valves are.
1. **A part can go below zero on hand with only a warning.** Useful for honesty, dangerous by accident: nothing afterwards flags a negative count on this page except the availability bar.
1. **Nothing here shows what a part is promised to.** The Promised column gives a number with no way to see which jobs hold it. Finding that out means opening jobs one at a time.
1. **A reorder point cannot be changed after the part is added.** It is set on the Add item form and there is no way to edit it afterwards, short of the database. Hovering the "Reorder" tag tells you what the number is, described as one job's worth.
1. **Value on hand uses today's cost, not what was paid.** It is a valuation at current prices, which will not match what the ledger says those units cost when they arrived.

GUIDE

Documents

Every customer agreement and work order in the business, in one list, with the state each one is in and a way to send the ones that can go.

Two documents belong to a job: the **customer agreement**, which the customer signs, and the **work order**, which the installer signs. A job waiting on both is two rows here, because it is two pieces of paper and two things to do.

Walked through on 2026-09-26 against the live app.

Getting there

Documents is in the top bar under Operations. The dashboard's paperwork panel links here.

The four cards

Card	What it counts
Cannot send yet	Documents waiting on the job, not on a person.
Out for signature	Sent and not signed back.
Signed	Done and on file.
Documents	The total, across all jobs.

These count **documents, not jobs**. Today the page reads 36 documents: 12 cannot be sent, 1 is out, 23 are signed.

Test jobs are left out of this page entirely, and there is no toggle to show them.

The tabs

All, Cannot send, Out for signature, Signed. They filter the sections below.

Cannot send yet, grouped by what is in the way

This section comes first on purpose. A document nobody can send is not waiting on a person, it is waiting on the job, and that work is invisible everywhere else. Rows are grouped by the reason, biggest group first, so the backlog reads as three problems rather than twelve.

Today it groups as 8 waiting on a date, 3 waiting on a crew, and 1 with no customer email.

A work order is checked in this order, and the first thing missing is the one you are told about:

Missing	What it says
A date	"This job has no date yet, so there is nothing to schedule a crew around."
A crew	"No installer is assigned, so there is nobody to send it to."
A crew email	"[Installer] has no email address on the roster. Add one in Settings."
A build sheet	"This job has no build sheet, so there is no parts list to put on the work order."
Parts on that sheet	"The [sheet] sheet has no parts on it, so the work order would tell the installer to bring nothing. Put its parts on the sheet first."
A payout	"This job has no installer payout, so the pay on the work order would be blank. Enter the payout on this job first."
A job number	"This job has no invoice number, and the work order document requires one. Add it on the job first."

A customer agreement has one rule: "This job has no customer email, so there is nobody to send the agreement to."

A cancelled job's unsent documents sit here too, with "This job is cancelled."

Each row

- **The customer name is a link** to the job, so a row that says "waiting on a crew" leads straight to where you fix it.
- **The document and the installer** are under the name.
- **The reason** is printed on the row whenever the send button is dead, not hidden in a tooltip, because these rows are read on tablets where there is no hover.
- **A coloured pill** gives the state: Not sent, Sent unsigned, Signed, Declined or Send failed.
- **When it was sent**, for anything out: "Sent today", "Sent 4 days ago".
- **How close the install is:** "Today", "Tomorrow", "In 5 days", "2 days overdue", or "No date". Overdue is red, within two days is amber.
- **A Send or Resend button**, dead when the document is blocked. A signed document has no button; it reads "On file".

Sending from here

Press Send. The page says which document went where: "Work order sent to jay.awoodward@gmail.com."

If it fails, the reason is shown in full rather than a generic failure, and the list reloads anyway, because a failed send is recorded against the job and leaving the old state on screen would hide it. The messages come from the sending function itself, for example:

This job has no customer email, so there is nowhere to send the agreement. Add one to the job first.

[Installer] has no payout on this job, so the agreed pay on the work order would be blank. Enter the payout on the job and send it again.

Customer Install Agreement is turned off. Turn it on in Settings first.

A resend sends a second document. It does not replace the first, and the copy already with somebody still shows the values it had when it went.

Signed in DocuSeal, missing here

At the bottom of the page is a panel that answers a different question: not "where is each of our documents" but "what has DocuSeal got that we have not".

Press **Scan DocuSeal**. It reads the whole DocuSeal account, signed and archived included, compares it with this app, and reports two lists:

- **Signed, with no job here.** Somebody signed and the job was never written up, so it holds no parts, is on no schedule and counts in no forecast.
- **Signed, job here, document not linked.** The job exists and its signed document is not attached, so the job reads as unsigned and keeps being chased.

Each row shows the signer, the document title, the date signed, and, where a work order title carries one, the scheduled day.

It is **read only**. It links nothing and creates nothing, on purpose: what to do about a gap is a decision. It also runs only when asked, because every scan reads the entire DocuSeal account.

Crew paperwork, a W9 or a subcontractor agreement, is left out. It is signed, real, and will never belong to a job.

Things people try that do not work

Resending a signed document. There is no button. A signed agreement is the end of the story. If the contract genuinely changed, start a new one in DocuSeal.

Sending a work order before the job is booked. A date comes first, then a crew, then a payout.

Fixing the blockage from this page. The reasons are printed here, but the job is where you fix them. That is what the name link is for.

Finding a test job. They are filtered out of this page with no way to show them.

Linking a signed DocuSeal document from the scan panel. It reports; it does not link. Linking is a change somebody has to ask for.

Rough edges

Found while walking the page. These are faults or decisions, not instructions.

1. **"Out for signature" includes documents that were never sent.** A document with nothing blocking it counts as out even before anyone presses Send. The single row in that section today is exactly this case: the quote named "Steve" has a customer agreement that says "Not sent" while sitting under "Out for signature". The count on the card is wrong in the same way.
1. **Quotes appear here as documents.** A quote is not a sale, but its customer agreement shows on this page like any job's. That is how "Steve" is in the list at all.
1. **A blocked row that can never clear stays forever.** The owner's own house has no customer email and never will, so its customer agreement sits in "Cannot send yet" permanently. Nothing lets you dismiss a row or mark it not needed.
1. **The cards count documents, the dashboard counts something slightly different.** The dashboard's paperwork line counts what somebody is sitting on; this page counts the whole book. Two different numbers about paperwork, neither wrong, easy to read as a disagreement.
1. **Failure text can be raw.** Most messages are written for a person, but a DocuSeal refusal can arrive as its own wording, and a template problem lists the template's field names on screen.
1. **The DocuSeal scan is not linked from anywhere else.** Nothing on the dashboard says gaps exist, so the panel is only found by somebody who already knows to scroll to the bottom of this page.
1. **The scan cannot see prices.** It reports which signed documents are missing from the app, but a hand written agreement keeps its price as printed text, so creating the missing job still needs somebody to read the document.

GUIDE

Schedule

Where the work sits in the week, who is doing it, and whether the parts for it are free. A job appears here the moment it has a date, and the date is what promises its parts.

Walked through on 2026-09-26 against the live app.

Getting there

Schedule is in the top bar under Operations.

The toolbar

- **Back and forward** step a week or a month, depending on the range showing.
- **Today** jumps back to now.
- **Week or Month** changes the range. Month shows the whole six row grid, so a job on the last day of the previous month is visible rather than hidden in a blank cell.
- **Calendar or List** changes the shape. The list shows unscheduled jobs first, then everything with a date.

The calendar

Each day holds a card per job. A card shows the customer, the address and city, the time window, the crew, the system, and a readiness badge.

The badge is about parts:

Badge	What it means
Ready	Every part on the list is free for this job.
Short N	N units are promised beyond what the shelf holds.
No parts listed	The build sheet has no lines on it.
No parts list	The job has no build sheet at all.
A missing pick	The faucet finish, RO type or valve type has not been chosen, so a line cannot name a part.

If the readiness check itself fails, a warning appears once at the top: the dates and crews below are still correct, but no card can say whether its parts are free. That is deliberate, because a card with no badge otherwise looks the same as a card that passed.

Unscheduled sits beside the calendar: sold jobs with no date yet, waiting to be dragged onto a day.

Test jobs are left off the calendar entirely, with no toggle to show them.

Moving a job

Hold a card and drag it to another day. That moves the date **only**: the crew stays as it is, because moving Thursday to Friday says nothing about who is doing the work.

When it lands, the page says so: "Glen Hooker moved to October 5, 2026." If the move leaves a part oversold it still moves, and says that too: "...moved to October 5, 2026, but 1 part is already short. Open the job to see which."

Installed and cancelled jobs cannot be dragged. Their date is a record of what happened, not a plan, and the card says so when you try.

Opening a job

Click a card, or a day header to see that day in full, then a job from there. The job window holds the date, the time window, the installer and the helper, and a parts check for the chosen date.

The parts check runs when the window opens and again after saving. It lists any part where the promises exceed the shelf, how many are short, and **which other jobs are holding them**, with their dates. That is the part worth reading: it names Samuelkuty Abraham on the 24th and Bruce Weislik on the 30th rather than just saying salt is short.

What blocks a save, word for word

A time window that is not on the list:

There is no time window called "Morning". Pick one from the list or add it in Settings.

The same person as installer and helper:

The installer and the helper cannot be the same person.

An installer who is not on the roster:

That installer is not on the roster. Reload and pick again.

An installer switched off in Settings:

[Name] is turned off on the roster, so they cannot be assigned new work. Turn them back on in Settings.

An installed job:

This job is already installed, so its date is a record of what happened. Reverse the install before rescheduling it.

A quote:

This job is still a quote. Mark it sold, or have the customer sign, before it can be scheduled or installed.

A job with an unanswered sales checklist is refused until every question has a real answer rather than "Not sure yet", and the message names the questions.

A window with no date is caught on the form: "Pick a date before picking a time window, or clear the window."

What happens after

- **Giving a job a date** makes it Scheduled and promises its parts for that day. Nothing leaves the shelf.
- **Clearing the date** puts it back to Sold, takes it off the calendar and releases the promises. Checked today: the reservations went to zero.
- **Moving a job** keeps the promises and moves them with it.
- **The parts are consumed only when the job is marked installed**, which happens on the job, not here.

Things people try that do not work

Dragging an installed job to a new day. Reverse the install first, on the job.

Dragging a quote onto the calendar. Quotes have no date. Mark it sold first.

Typing a time window of your own. The list comes from Settings.

Expecting a booking to take stock off the shelf. It reserves; it does not deduct.

Expecting a short badge to stop a booking. It will not. The board books the job and tells you what is short, because the fix is usually to order a part rather than to refuse the customer.

Looking for a test job. They are filtered out of this page.

Rough edges

Found while walking the page. These are faults or decisions, not instructions.

1. **The Ready badge and the reservations can disagree.** The badge's shortage check reads the job's build sheet, while the parts actually promised come from the job's own parts list when it has one. A job

listing its own parts can therefore show Ready while the dashboard counts it short.

1. **Moving a job out of the range on screen makes it vanish.** The page reloads only the dates in view, so dragging into next month, or saving a new date from the job window, removes the job from sight before the confirmation can be read.
1. **The job window opens on top of the day window.** One press of Escape closes both, and any unsaved date or crew goes with it.
1. **A short job books silently as far as the calendar is concerned.** The notice naming the shortage appears once, above the board, and is gone on the next action. Nothing on the card afterwards says the move caused it.
1. **The unscheduled rail only exists in Calendar view.** Switch to List and undated jobs are mixed in at the top instead, which is a different idea of the same thing.
1. **Nothing here shows the money.** A day with four installs gives no sense of the value or the payout involved, which is what a week's plan is usually judged on.
1. **Drag and drop is the only way to move a job on the board.** There is no keyboard equivalent, so the calendar cannot be worked without a pointer.
